*Acta Palaeontologica Polonica* 64 (2), 2019: 275-290 doi:<https://doi.org/10.4202/app.00581.2018>

We here present a new hyaenodont genus and species from the Lutetian locality of Egerkingen γ (Switzerland; MP13?): *Cartierodon egerkingensis* gen. et sp. nov. The new taxon is represented by numerous dental elements, mostly isolated teeth. The molars show typical features of a hypercarnivorous predator such as the strong reduction of the crushing (taloid/protocone) and puncturing (metaconid) structures. The calculation of several dental indices indicates that this hyaenodont may have been a bone-cracking predator. The new taxon differs from all the hyaenodonts previously known in Europe during the Ypresian and Lutetian by its larger size, with an estimated mass of almost 29 kg (the size of the extant African wild dog, *Lycaon pictus*). Other hyaenodonts known for this period do not exceed 20 kg. Previous authors proposed the hypothesis of an ecological limitation of the body mass, but the description of *Cartierodon egerkingensis* indicates instead that the European hyaenodonts continuously increased in size throughout the Eocene. We also performed a phylogenetic analysis in order to test the relationships of this new taxon: the new hyaenodont appears to be closely related to the Lutetian hyaenodont *Prodissopsalis eocaenicus*.

**Key words:** Mammalia, Hyaenodonta, *Cartierodon*, ecology, phylogeny, Eocene, Switzerland.
