

New material of a derived ornithomimosaur from the Upper Cretaceous Nemegt Formation of Mongolia

Robert Bronowicz

Acta Palaeontologica Polonica 56 (3), 2011: 477-488 doi: <http://dx.doi.org/10.4202/app.2009.1123>

New material of an ornithomimid from the Late Cretaceous deposits of Tsagan Khushu (Gobi Desert, Mongolia) is described. The material includes a partial axial skeleton, and hind and forelimb elements. The specimen is similar to *Anserimimus planinychus* from nearby Bugin Tsav locality in having ventrally flat, long, almost straight manual unguals. The new specimen differs from *A. planinychus* in the length of the penultimate manual phalanx II-2, which is only slightly shorter than Ph III-3, in a considerably lesser alae of the manual unguals, and in the height/width ratio of the proximal articular surfaces. The material suggests presence of third, hitherto unknown ornithomimid from the Nemegt Formation.

Key words: Dinosauria, Ornithomimidae, *Anserimimus*, Cretaceous, Nemegt, Mongolia.
