Acta Palaeontologica Polonica 59 (4), 2014: 843-854 doi: <http://dx.doi.org/10.4202/app.2012.0069>

Trigonoolithus amoa oogen. et oosp. nov. is described on the basis of abundant eggshell fragments from the La Cantalera 1 site in the Early Cretaceous (early Barremian) Blesa Formation, Teruel Province, northern Spain. The surface ornamentation, the most diagnostic feature of the new oogenus, consists of closely spaced sub-triangular or rounded protuberances that have not previously been reported in any other ootaxon. The eggshells present three distinct layers, with a gradual transition between prismatic and mammillary layers, and a poorly developed external layer with progressive prismatic to external layer transition, a combination of characters that allows them to be assigned to Prismatoolithidae. Phylogenetic analyses based on oological characters place *Trigonoolithus* at the base of Prismatoolithidae.

Key words: Dinosauria, Theropoda, Prismatoolithidae, parataxonomy, dinosaur eggshells, Barremian, Cretaceous, Blesa Formation, Teruel Province, Spain.
