

A tapir tooth from Nowa Wieś Królewska near Opole (Poland)

Zbigniew Ryziewicz Acta Palaeontologica Polonica 06 (4), 1961: 331-338

A tapir lower premolar (P2), collected from the Miocene (Sarmatian) of Nowa Wieś Królewska near Opole, is described. Its identification as *Tapirus* cf. *telleri* Hofmann may be also based on similarities displayed by the mammalian assemblage from Opole to that from Göriach which yielded remains of *Tapirus telleri* Hofmann.
